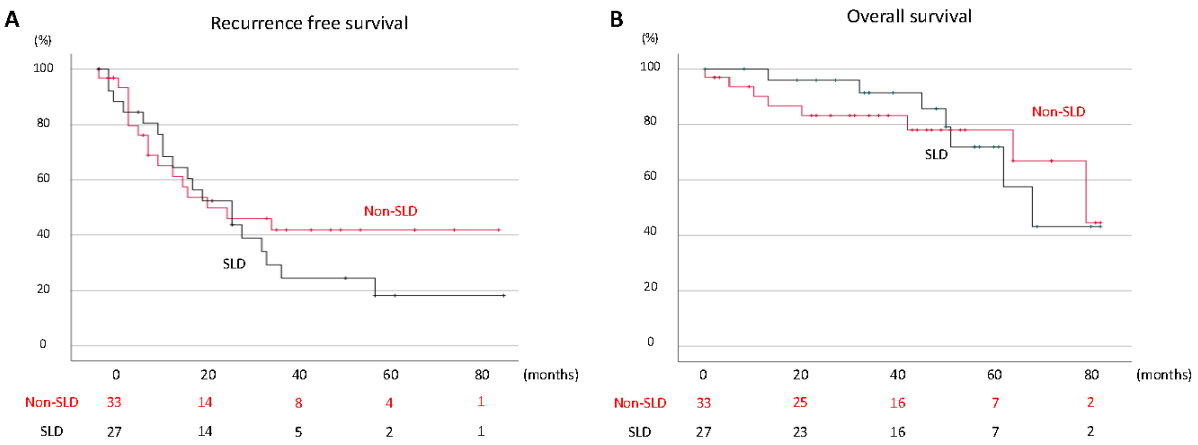
Supplementary Data



Supplementary Figure S1. Kaplan–Meier curves for RFS and OS in the non-viral hepatocellular carcinoma cohort. Patients with hepatitis B or C virus infection were excluded from the analysis. **(A)** RFS curves for patients with and without SLD (log-rank $p = 0.399$); **(B)** OS curves for the same patient groups (log-rank $p = 0.936$). Censored data are indicated by tick marks on the Kaplan–Meier plots. *Abbreviations*: OS, overall survival; RFS, recurrence-free survival; SLD, steatotic liver disease.

Supplementary Methods/Results

The association between the FIB-4 index and histological fibrosis (F0–2 *vs.* F3–4) was assessed using a point-biserial correlation analysis. A weak positive correlation was observed ($r = 0.279$, $p = 0.010$). This analysis assessed correlation rather than agreement between the two measures.
